**PROJECT DESIGNATION**: **BiON**

DESCRIPTION: The BiON project aims to develop a **business intelligence solution** capable of integrating operational and administrative data from the most varied sources of information associated with Grupo Visabeira (GV). These sources represent great value supporting important decisions. GV represents a unique sampling environment on the market, with unlimited possibilities, so it will allow access to a large dynamic volume of information and the results of the testing process will be extended to all business areas.

GOALS: The BiON project focusses on the development of a Business Intelligence solution for all GV's analysis areas, available online (24/7), with real-time information for monitoring and decision-making, both at operational and administrative level.

VISABEIRA I&D'S ROLE: Carry out the transition from static data structures (from the most varied systems, logs and assigned meta data), to dynamic on-demand data structures; create unique and perishable datasets, stored in dynamic memory for each individual user (information processed according to the relational key as well as to differentiated and accredited sampling).

RESULTS: Business Intelligence system using dynamic tables of source data.
